## **Aim**

“Henshiko (Pien Tze Huang)” has been recognized as a famous Chinese medicine for the liver diseases. But there are some problems of the efficacy to the HCV patients and The Washington Treaty for the rear animals. The “Yojoy Henshiko” is developed to clear these problems and its efficacy for the hepatitis. In the present study, we examined the effect of the prescription on patients with liver diseases.

## **Method**

For the hepatitis patients who could not get any improvement of a liver function even going to the hospital and had some treatment, we gave suitable and sufficient instruction directly by the person who is in charge of this matter. And by the free will of the patients and on the condition of continuing to go to hospital to have examinations, the prescription was given after each meal three times a day. In addition, liver function inspection was carried out in the hospital where they go, according to the conventional medical treatment, and examination was added on the basis of the inspection results offered by their intentions.

## **Results**

Serum levels of ALT and AST in the four patients treated were markedly lowered after treatment with the prescription for 10 days. Comparing the Serum levels with their pre-administrated values, the AST levels were decreased to 76% and the ALT levels were to 33% in the mean values of the four patients.

## **Conclusion**

These results substantiate clearly the effect of “Yojoy Henshiko” in lowering the enhanced serum levels of ALT and AST in the patients with hepatic diseases.
